The bootstrap package in R offers data analysis part for the book "An Introduction to the Bootstrap" by B. Efron and R. Tibshirani, 1993, Chapman and Hall. It mainly contains some useful functions for bootstrap, cross-validation, jackknife method as well as a bunch of data set. As the author mentioned, new projects should preferentially use the recommended package "boot", but here we are more interested in the jackknife part of those functions. For this short presentation, I found some examples to display how to apply these simple but quite useful functions.

Please find the manual here [bootstrap.pdf](#), and R examples [bootstrap in R.txt](#)
